SPEP Integrity Extended Metaphor Essay

My life can be compared to building a computer. A computer is made of a bunch of different parts, and they all have to work together. If one part is missing or messed up, then the computer might not work right. My life is kind of the same. I have goals, habits, family, school, and my own personality. Some parts are stronger than others, and some parts still need work. I am still building my life, just like someone slowly building a PC

STRUCTURE

The structure of my life is like the case and motherboard of a computer. The case holds everything in place, and the motherboard is where everything connects. For me, my structure is my school, my family, and the goals I am trying to follow. I want to keep learning about computers and technology, so that gives me something to build around. Without the motherboard, all the computer parts would just be sitting there and not doing anything. Without structure in my life, I would probably just have random ideas but not a real plan.

STYLE

The style of my life is like the way a computer looks on the outside. Some computers have lights, clean colors, or a cool design. That is what makes them different from other computers. My style

is the stuff that makes me feel like myself. I like technology, coding, and making things. I also like having my own ideas instead of just copying everyone else. A computer can still work even if it looks different, and I think people are the same way. My life does not have to look exactly like someone else's life to be good.

COHESION

The cohesion in my life is like the wires and operating system in a computer. The parts need something to connect them, or else they will not work together. In my life, my values connect everything. Things like effort, honesty, and trying again are important to me. I do not always do everything perfectly, but those values help me come back to what matters. School, projects, family, and my future can feel like separate things sometimes. But they all connect because they are helping me become better. Like a computer, everything needs to be connected or it gets messy.

STRENGTH

The strength in my life is like the power supply and the cooling system. A computer needs power to run, but it also needs to stay cool so it does not overheat. I need that too. I get stressed from school, grades, and trying to figure out my future. Sometimes things do not go how I want. Sometimes I procrastinate or get frustrated. My strength is that I can still keep going. Even if I mess something up, I can try to fix it. Just like a computer needs cooling when it is working hard, I need breaks and patience when life gets stressful.

DURABILITY

The durability of my life is like upgrading and taking care of a computer over time. A computer does not stay good forever if you never update it or clean it. It needs repairs and better parts sometimes. My life is the same because I am not done growing. I still need to learn more, make better habits, and fix mistakes. I know I will change over time, and my plan might change too. That does not mean the plan failed. It just means I am upgrading it. Being durable means I can keep improving instead of giving up when something breaks.

DIRECTION

The direction in my life is like the person using the computer. A computer can be really powerful, but it still needs someone to tell it what to do. My direction comes from my goals and the people who help me. My family, teachers, and the things I want in the future all push me forward. I want to use technology and computer science to build a good future for myself. I do not know every step yet, but I know the general direction I want to go. Without direction, all the parts would just sit there. Direction is what makes everything actually move.

My life is still being built. It is not finished, and it probably will not be finished for a long time. But a computer is built one part at a time, and that is how I see my life too. My structure, style, cohesion, strength, durability, and direction all help me become stronger. Some parts are already working, and some parts still need to be fixed. That is okay. What matters is that I keep building my life with integrity and keep trying to make it work better.
